

Acquired Brain Injury

Executive Summary

Acquired brain injury (ABI) refers to any damage to the brain that occurs after birth.¹ Traumatic brain injury is an ABI caused when an external force applied to the head injures the brain, such as from physical assaults, sport-related injuries and falls.² ABI is common in children with a history of family violence and child abuse.³

The [Brain Injury Association of Tasmania](#) has noted that:

Some people with ABI are at greater risk of entering the criminal justice system due to the effects of trauma to the brain after sustaining a brain injury. They may experience life-long changes to their behaviour and personality, physical and sensory abilities, or thinking and learning. The risk can be further heightened due to a range of other factors including: an increased risk of onset of mental health issues, inadequate or non-existent support and care co-ordination, loss of income and poverty at times resulting in homelessness, decrease in social networks and loss of education and employment opportunities.⁴

The 2012 NSW Law Reform Commission inquiry into [People with Cognitive and Mental Health Impairments in the Criminal Justice System](#) found:

People with ABI are more likely to come into contact with the criminal justice system, where they have problems arising from impulsive behaviour, anger and aggression, increased use of alcohol and other drugs, poor self-monitoring, poor concentration, lack of inhibition, inflexibility, impulsivity, an inability to read social cues and memory loss'.⁵

ABI can result in 'deterioration in cognitive, physical, emotional or independent functioning'.⁶ Research has found high rates of comorbidity between ABI and mental illness.⁷

The presence of an ABI also has familial and societal impacts, 'can exacerbate and magnify the risk factors associated with homelessness'⁸ and may result in 'significant restrictions on an individual's ability to participate fully in education, employment and other aspects of life.'⁹

The potential relevance of evidence of ABI in sentencing proceedings includes an assessment of *moral culpability*; moderating the weight to be given to *general deterrence*; and determining the weight to be given to *specific deterrence* and *protection of the community*. There may also be issues relating to the likelihood of *hardship in custody*, a finding of *special circumstances* and the shaping of conditions to enhance prospects of *rehabilitation*.
